

MARKO KAZIMIROVIC

LOW-LEVEL SYSTEMS AND RUNTIME DEVELOPER

Phone : (+381)060-5582988
Email : kazimirovicmarko@proton.me
Website : <https://yepistream.github.io/>
Github : <https://github.com/yepistream>

Technical Skills

- OpenGL/Vulkan
- HLSL/GLSL Shaders
- Unity, Unreal & Godot SDK
- Device Drivers
- Low-Level Optimizations
- Sensor Fusion
- SLAM
- ML Vision
- Optical Calibration
- Open XR Runtime
- Open VR SDK
- General Runtime And System Ownership And Design
- Three.JS

Languages

- Serbian - Native
- English - C1

PROFILE_SUMMARY

Self-Taught VR/AR systems and Graphics engineer with deep love for hardware-software integration, real-time rendering pipelines, spatial computing, and low-level optimization for immersive computing platforms.

PROJECTS

• AUGMENTED INSANITY

2025-....[in-Dev]

A OpenXR runtime based on Monado, made to be fully modular and to allow an easier way to develop XR Features and Drivers. Started off as the “[Fully Mobile XR Runtime](#)” project and then evolved into a completely separate flexible and modular OpenXR Runtime.

Github : <https://github.com/yepistream/Augmented-Insanity>

• FULLY MOBILE XR RUNTIME

2025-....[in-Dev]

A OpenXR runtime based on Monado, aimed to allow mobile phones to be used as fully-fledged VR Headsets. A lot of low-level optimizations to balance ARCore and Hand Tracker load on both performance and heat-throttling on mobile phones. This is now being slowly converted into a based module-set for “[Augmented-Insanity](#)”.

Github : <https://github.com/yepistream/FullyMobileVR>

• TINY HAND TRACKER

2026-....[in-Dev]

Tiny Hand Tracker is a, well, tiny hand tracker. Instead of running an ML for palm detection → R.O.I → LandMark Detection + Depth Fusion. We run a calibration step using Depth API for hand size and Color Ranges Then We Use Color/Texture Shader → BBox Around It → Find orientation using a very low-overhead algorithm I’m currently testing out + calibration depth size fusion.

• JAILED THREE JS RUNTIME

2024-2025 [Beta]

Jailed Three JS Runtime is based off of Three.JS library, it is meant to seamlessly incorporate threejs and 3D Graphics into Web Design. Fuses HTML and CSS with ThreeJS, allowing ThreeJS to be written as if it were normal DOM elements. Meant to allow for quick-&-easy prototyping, designing and shipping Web Applications that wish to use 3D Graphics.

Github : <https://github.com/yepistream/JailedThreeJS>

SMALLER PROJECTS

→ SORCHERER

2025-2025 [Release but still working on it from time to time]

A JavaScript Library For Fusing 3D ThreeJS Objects with 2D DOM Elements. A library I made as I wanted 2D DOM Elements To Be Easily Writable and directly used inside the ThreeJS 3D Space.

Github : <https://github.com/yepistream/Sorcherer>

CANVAS ON KANVAS ←

2024

A Small Helper Script, made in one day. Allows for using WebGL Shaders on 2D Canvas's by overlaying a WebGL Canvas Over The 2D Canvas.

Github : <https://github.com/yepistream/Canvas-On-Kanvas>

EDUCATION

TECHNICAL SCHOOL NEGOTIN - SERBIA

Vocational Secondary School Diploma, Information Technology Technician
2020 - 2024

ACADEMY OF APPLIED TECHNICAL STUDIES NIŠ DEPARTMENT — SERBIA

Information Technology and Systems, Second-Year Student
Expected Graduation - 2029

OTHER_INTERESTS

Huge Interests In Physic Engines.
Hardware and Integrated Circuits.
Photonic Computers.
rule-based / declarative programming.
Cellular Automata / Game Of Life.
